

1 SUWADA' s nail nippers are made of round rods of High carbon stainless steel. They are carefully selected materials, and all smelted in Japan.

2 A round rod heated to high temperature over 1000 degrees is forged with 400 tons of pressure. The material is trained heavily. The craftsmen breathe new life into the steel.

3 The forged rod is cut out according to the mold. Only the central area of materials can become nail nippers. Actually it is approximately 30% of raw materials.

4 All processes are done by hands of skilled craftsmen. Their small, delicate and proper works pile up and make the basis of function and beauty.

5 The left and right parts cut out are riveted. Eventually they become the original "shape" of nail nippers.

6 Craftsmen grind and polish using various sandpapers. Starting from coarse sandpapers progressively to finer ones, the beautiful shape is gradually formed.

7 Extremely thin blades are formed with gentle curve which fits the line of nails. The sharpness of edge is trusted by professionals at nail salons and clinics, and discerning consumers.

8 Craftsmen adjusts the blades in increments of 1/1,000 millimeter for the perfect finish with no gap. Through these processes with the final inspection, our products become the best ones at last.
